SLEEVES

AISI-304 stainless steel braid

AISI-304 stainless steel mesh for protecting hoses, pipes, cables, etc. Resistant to heat, oil, corrosion, abrasion, rust, weathering, and animal damage. Flexible material that expands to fit the hose or cable, then can be cut to the desired length with scissors. Used to create a professional appearance and protect cables in the automotive industry, cleanrooms, processing and manufacturing plants, and on engines or hydraulic and pneumatic equipment. For bundling electrical or electronic cables. Designed to grip securely with stainless steel cable ties, heat shrink tubing, and other clamps for a perfect installation. Blocks electromagnetic (EMI) and radio frequency (RFI) interference from entering or leaving the cable. In some cases, the mesh can help dissipate heat generated by the cables themselves. Being metallic and conductive, the mesh can be used as a continuous ground path for all wiring, providing electrical safety and aiding in shielding.
